

Atlas Migration — Your Final Steps

Everything is built and tested. These are the only parts that need **you** (because of the Atlas login / MFA). About 20 minutes total. Do them in order.

1 Approve the data

Tick each box. Only one needs a real decision — the interval policy.

- ☐ The numbers look right (1,358 records; 296 overdue).
- ☐ **Interval policy:** Makaton, Record Keeping, Risk Assessment, Driver Safety = **3-YEAR** expiry. YES, 3yr / Change to: _____
- ☐ OK that 7 unclear-surname records are entered later, not now.
- ☐ OK to auto-enter into Atlas (or I'll sit and watch it = "assisted").

2 Capture the form fields (~5 min, once)

This teaches the tool where the boxes are on the Atlas screen.

- a) Log into Atlas. Open **Add result** for any one staff member.
- b) Press **F12**, click the **Console** tab.
- c) Open the file `capture_selectors.js`, copy it all, paste into the Console, press **Enter**.
- d) It prints a table. **Send that table to Claude** and it fills in the rest for you.

3 Log in once

On your PC, in the `swarm` folder, run:

```
python login_bootstrap.py
```

A browser opens. Log in with your password + MFA. Press Enter. It saves your session.

4 Check it's ready

```
python preflight.py
```

It must say **READY**. If not, it tells you exactly what's missing.

5 Test on 10, then run it all

```
python run_worker.py --worker pilot --start 1 --end 10
    (check those 10 in Atlas look right, then:)
./run_swarm.sh 1 296 5          # the 296 overdue first
./run_swarm.sh 297 1358 5       # the rest
python merge_results.py         # final count = 1,358
```

You watch each record go in, live, on screen. A screenshot is saved for every one.

If anything stalls: send Claude the screen output and it handles the rest. The only things Claude cannot do are Steps 2 & 3 (your Atlas login).
